Costume Search: Networking - Beginner

Creator: Alex Vazquez Points: –

Description

This is a networking challenge focused on Wireshark and TLS decryption. The objective is to analyze the provided packet capture and recover information hidden within encrypted TLS traffic. Using the provided key file, decrypt the TLS traffic in Wireshark and inspect the resulting HTTP traffic to locate the hidden flag and information.

Github Path: Path to github once it has been added to the repo

Prompt

I forgot to buy my costume and had to do some last-minute costume shopping. I found the costume, but now I can't remember where the order information went. Thankfully, I still have the key and a packet capture. Use Wireshark to decrypt the traffic and find what I'm looking for!

Hints

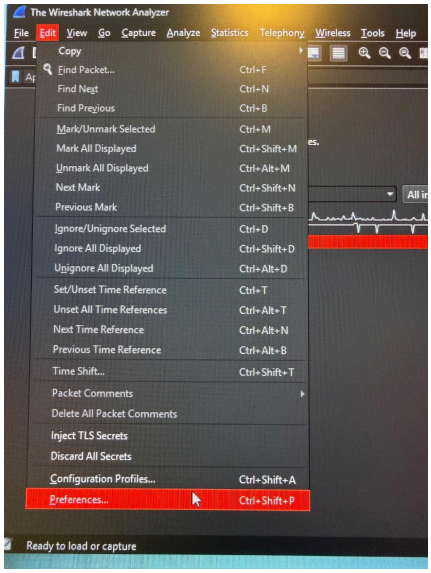

1. Wireshark can't read the encrypted traffic automatically. It can use a text file as a key.
2. Look into protocol preferences to feed it the Master-Secret file. Name is a hint.
3. Don't get lost in the noise. Try filtering network traffic using the top search bar to look for a specific part of the flag format.

Solution

1. Open the .pcapng file with Wireshark

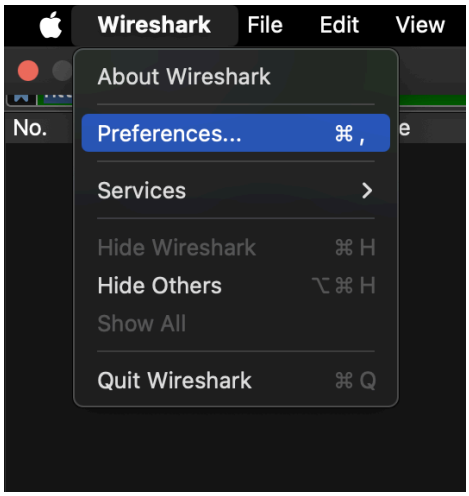

2a. WINDOWS

- Click edit, then preferences(ctrl + shift + P)

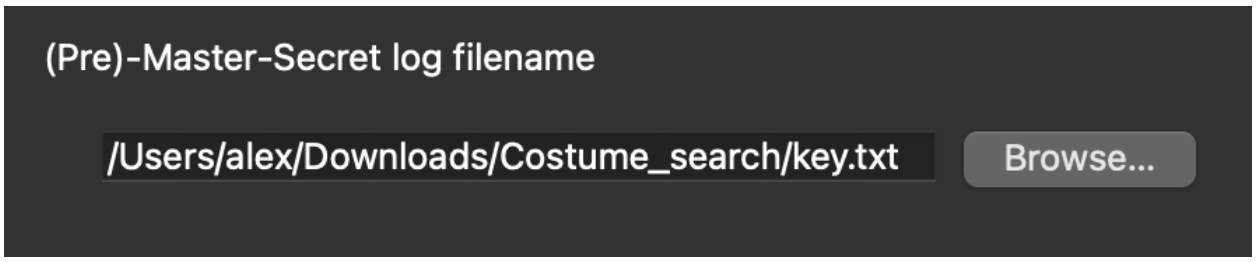

2b. MAC

- At the top, click on Wireshark, then preferences(⌘ + ,)

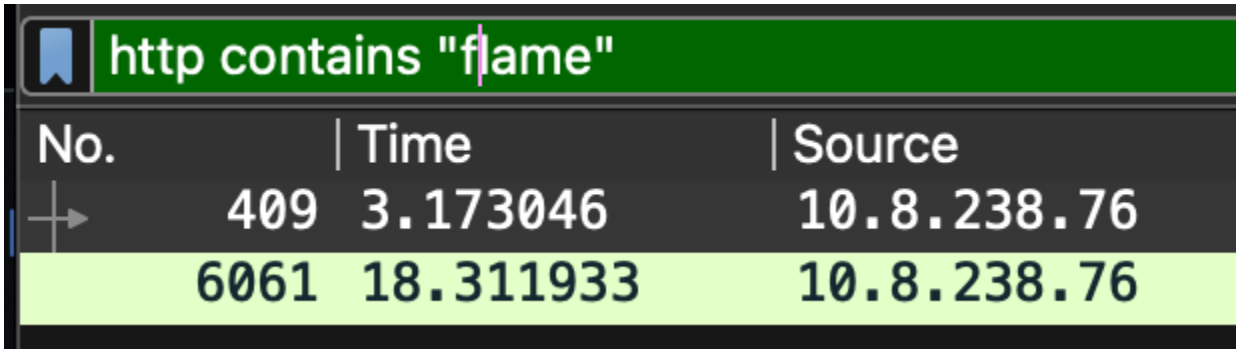

3. Click on protocols and scroll down for TLS
4. Click on browse where it says (Pre)-Master-Secret log filename

5. Go to Costume_search -> Assets

6. Click and open sslkeylog.txt or double click
7. Search http contains “flame” in the top bar
8. Click on packet No. 6061

9. Click Line-based text data or scroll down

Flag

flame{costume_found}
